

UCLA Institute for Quantitative and Computational Biology

## W5b: RNA-Seq II Analysis

Workshop W5b, 12<sup>th</sup> March 2020

**Day 2**

**Karolina E. Kaczor-Urbanowicz, PhD**

UCLA School of Dentistry, Department of Oral Biology & Medicine

(Area of interests: salivary RNA Sequencing, bioinformatics and biomarker development for many oral and systematic diseases)

&

**Nicolas Rochette, PhD**

UCLA Department of Ecology and Evolutionary Biology & the Institute for Society and Genetics

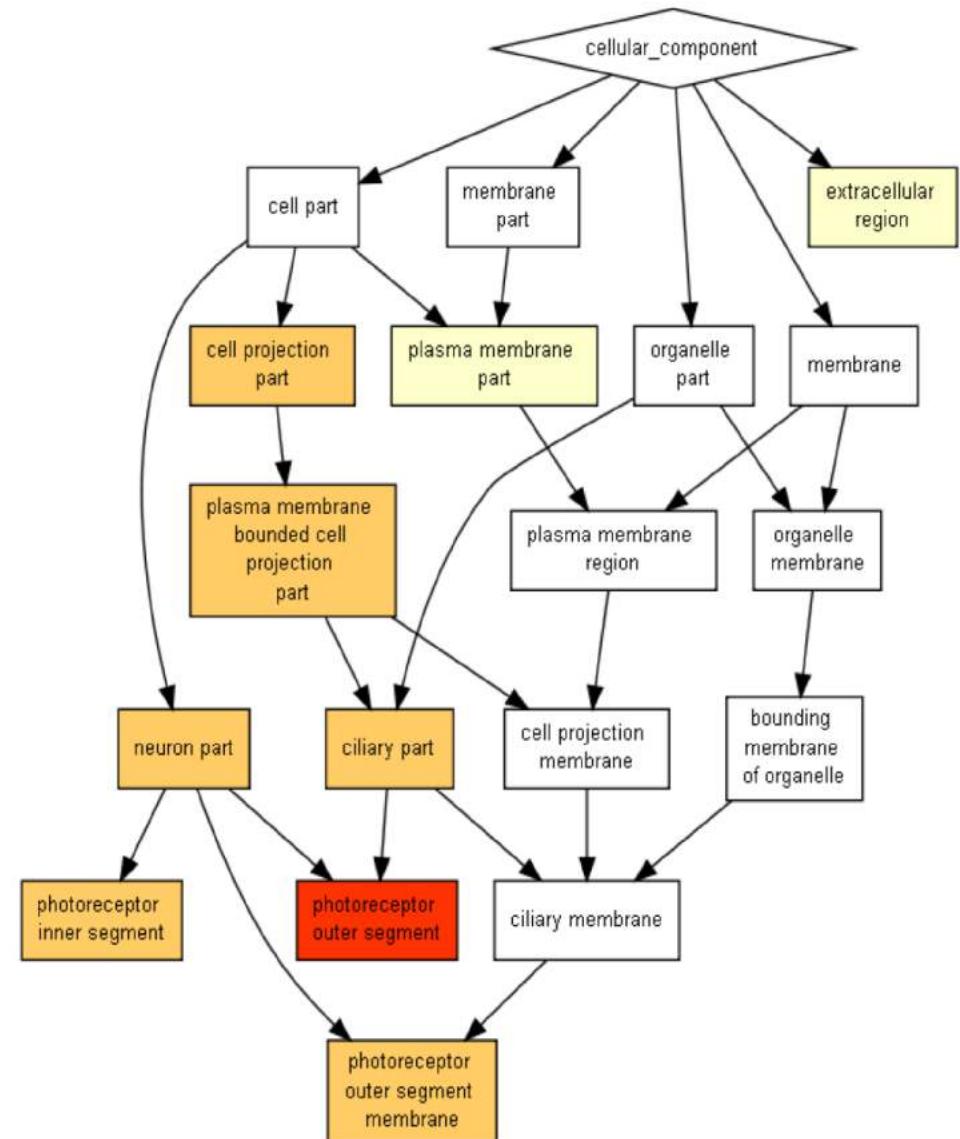

(Area of interests: population genomics and evolutionary physiology, the dynamics of adaptation)

# Gene Set Enrichment analysis

- It can be hard to interpret all differentially expressed genes one by one (too many DEGs);
- You often want to get bigger picture of what is changing in transcriptomes (which pathways or categories of genes are changing);
- You may want to ask specific questions about particular groups/categories of genes;
- You may want to check if the list of genes you have is completely random or reflects some biology;
- Common approach is an identification of predefined sets of genes that are over-represented among genes of interest (e.g. differentially expressed genes) – **gene set enrichment analysis (or functional enrichment analysis)**;

# Gene Ontology - ontologies

- GO is a collection of controlled hierarchical vocabularies of defined terms representing gene properties;
- GO is structured as a directed acyclic graph where each term has defined relationships to one or more other domains ("parent" – "child");
- GO terms may have more than one parent term;
- GO vocabulary is designed to be species-agnostic;
- There are three separate domains of GO:
  - Biological Process (BP): "Visual perception" (GO:0007601);
  - Molecular Function (MF): "**G-protein coupled receptor activity**";
  - Cellular component (CC): "photoreceptor outer segment".
- GO can be browsed at:
  - [http://amigo.geneontology.org/amigo/dd\\_browse](http://amigo.geneontology.org/amigo/dd_browse)

# AmiGO 2

More information on quick search [?](#)

Quick search

Search

## Search Templates

Use predefined **templates** to explore Gene Ontology data.

[Go »](#)

## Advanced Search

Interactively **search** the Gene Ontology data for annotations, gene products, and terms using a powerful search syntax and filters.

[Search ▾](#)

## Browse the Ontology

Use the drill-down **browser** to view the ontology structure with annotation counts.

[Go »](#)

## GOOSE

Use **GOOSE** to query the legacy GO database with **SQL**.

[Go »](#)

# Gene Set Enrichment analysis

- There are MANY databases and annotations that can be used for functional enrichment analysis:
  - Gene Ontology – major framework for functional annotation of all genes in all species using controlled vocabulary (<http://www.geneontology.org/>) ;
  - KEGG pathways – manually curated database of biological pathways (<http://www.genome.jp/kegg/>) ;
  - Molecular Signatures Database (MSigDB) – collections of annotated gene sets for GSEA tool;
- There are MANY tools, packages and online-servers for functional analysis of gene lists (DAVID, GSEA\*, Gorilla, many packages in Bioconductor: `limma`, `goseq`, `gostats`, `topGO` etc);

GSEA (free): <http://www.broadinstitute.org/gsea/index.jsp> – Use GSEAPreranked for complex study designs

GOStats R package: (free) <http://www.bioconductor.org/packages/release/bioc/html/GOstats.html>

topGO R package (free): <http://www.bioconductor.org/packages/release/bioc/html/topGO.html>

Ingenuity Pathway Analysis (not free)

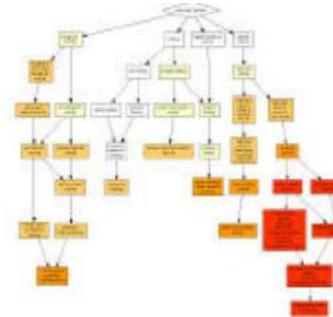

<https://biit.cs.ut.ee/gprofiler/gost> => Also available in R

# Gene Ontology analysis using GOrilla

<http://cbl-gorilla.cs.technion.ac.il/>

*GOrILLA*

*Gene Ontology enRICHment anaLysis and visuaLizAtion tool*

[HTML] **GOrilla**: a tool for discovery and visualization of enriched GO terms in ranked gene lists

E Eden, R Navon, I Steinfeld... - BMC ..., 2009 - [bmcbioinformatics.biomedcentral.com](http://bmcbioinformatics.biomedcentral.com)

Since the inception of the GO annotation project, a variety of tools have been developed that support exploring and searching the GO database. In particular, a variety of tools that perform GO enrichment analysis are currently available. Most of these tools require as input

☆ ⓘ Cited by 1341 Related articles All 22 versions Web of Science: 926 ☺

# Gene Ontology visualization by GOrilla

## Choosing your final gene set for GO analysis:

1. p-value
2. Logfoldchange
3. Association with your condition

- You need 3 files :
  - 1) Gene upregulated
  - 2) Gene downregulated
  - 3) Background gene
- *Comparison to proper background set of genes can be critical;*
- Upload files to the GOrilla:
  - <http://cbl-gorilla.cs.technion.ac.il/>

What is the proper **background gene list** to use when performing pathway analysis?

- The conclusion is that we should use a **list of background genes that are expressed in the samples** but not using the **entire mouse genes** in the mouse genome [a list of genes whose average expression (raw counts) is **greater than 10** in **at least one** of the two groups, that you will be comparing].

# Gene Ontology analysis using GOrilla

choose species →

Step 1: Choose organism

Step 2: Choose running mode

Single ranked list of genes    Two unranked lists of genes (target and background lists)

Step 3: Paste a ranked list of gene/protein names ← choose running mode

Names should be separated by an <ENTER>. The preferred format is gene symbol. Other supported formats are: gene and protein RefSeq, UniProt, Unigene and Ensembl. Use [WebGestalt](#) for conversion from other identifier formats.

Target set:

Or upload a file:  genes.down.txt ← file with a list of DEGs

Background set:

Or upload a file:  genes.all.txt ← file with a background set of genes

Step 4: Choose an ontology

choose ontology →  Process    Function    Component    All

---

Advanced parameters

p-value threshold:  →

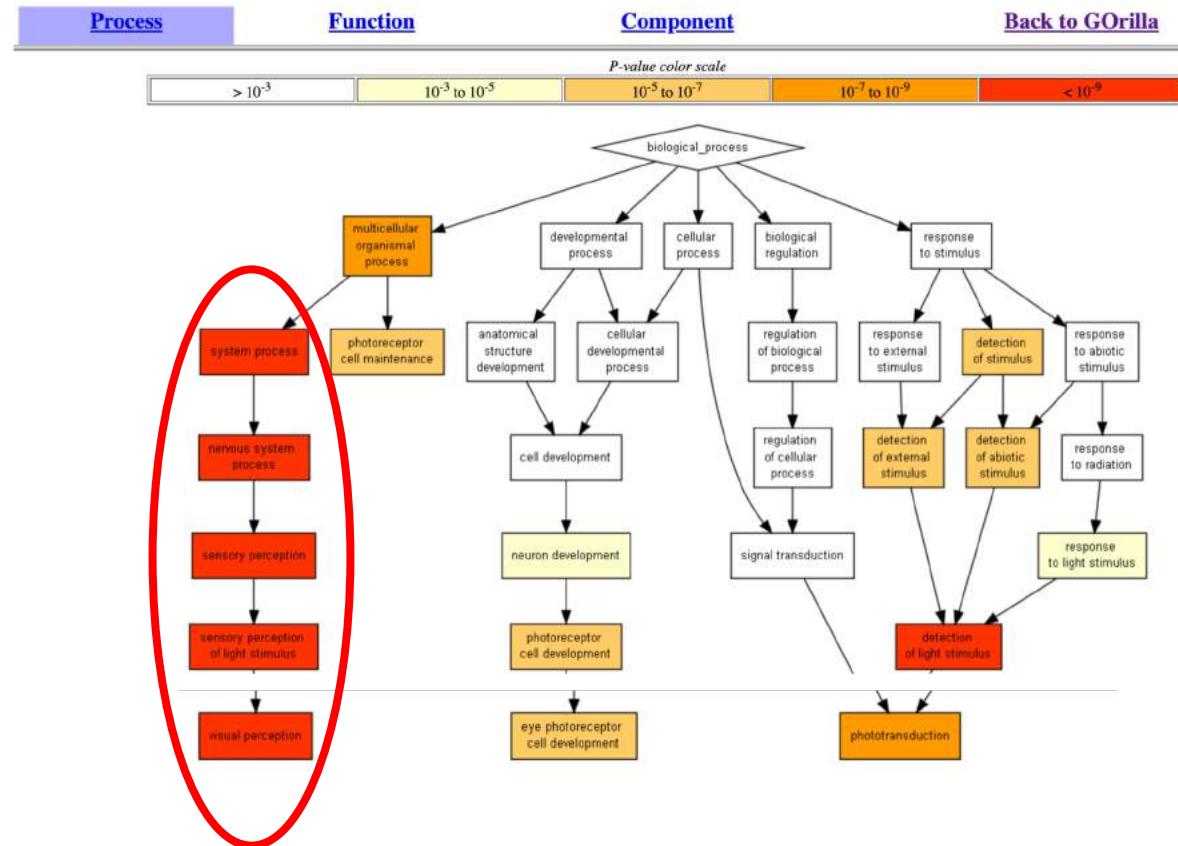

Analysis name:  (optional)

E-mail address:  (optional - enter an e-mail address if you would like to receive a link to your results)

# Results for “DOWN”-regulated genes - GOrilla

## Process

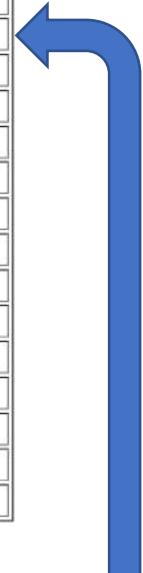

“GO” terms can be very broad, But it gives a “big picture”, but interpreting some particular can be difficult, not so easy

# Results for “DOWN”-regulated genes - GOrilla

## No GO Enrichment Found

There are no GO terms with an enrichment p-value above the value you specified

Species used: *Mus musculus*

The system has recognized 12535 genes out of 12946 gene terms entered by the user.

12535 genes were recognized by gene symbol and 0 genes by other gene IDs .

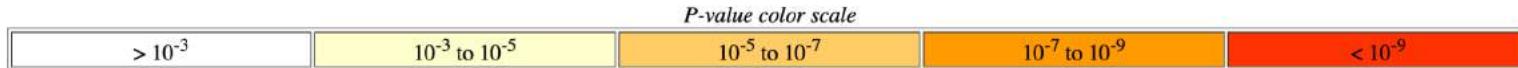

322 duplicate genes were removed (keeping the highest ranking instance of each gene) leaving a total of 12213 genes.

Only 12074 of these genes are associated with a GO term.

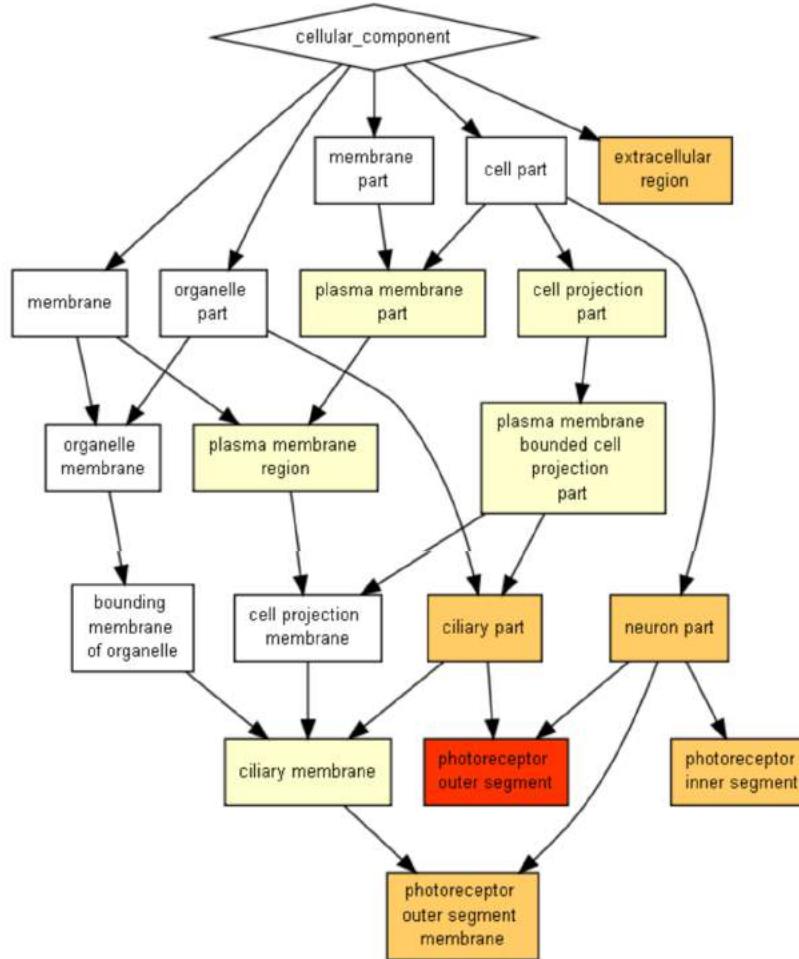

The GOrilla database is periodically updated using the [GO database](#) and other sources.

The GOrilla database was last updated on Oct 26, 2019

## KEGG PATHWAY analysis

## Retrograde endocannabinoid signaling - Homo sapiens (human)

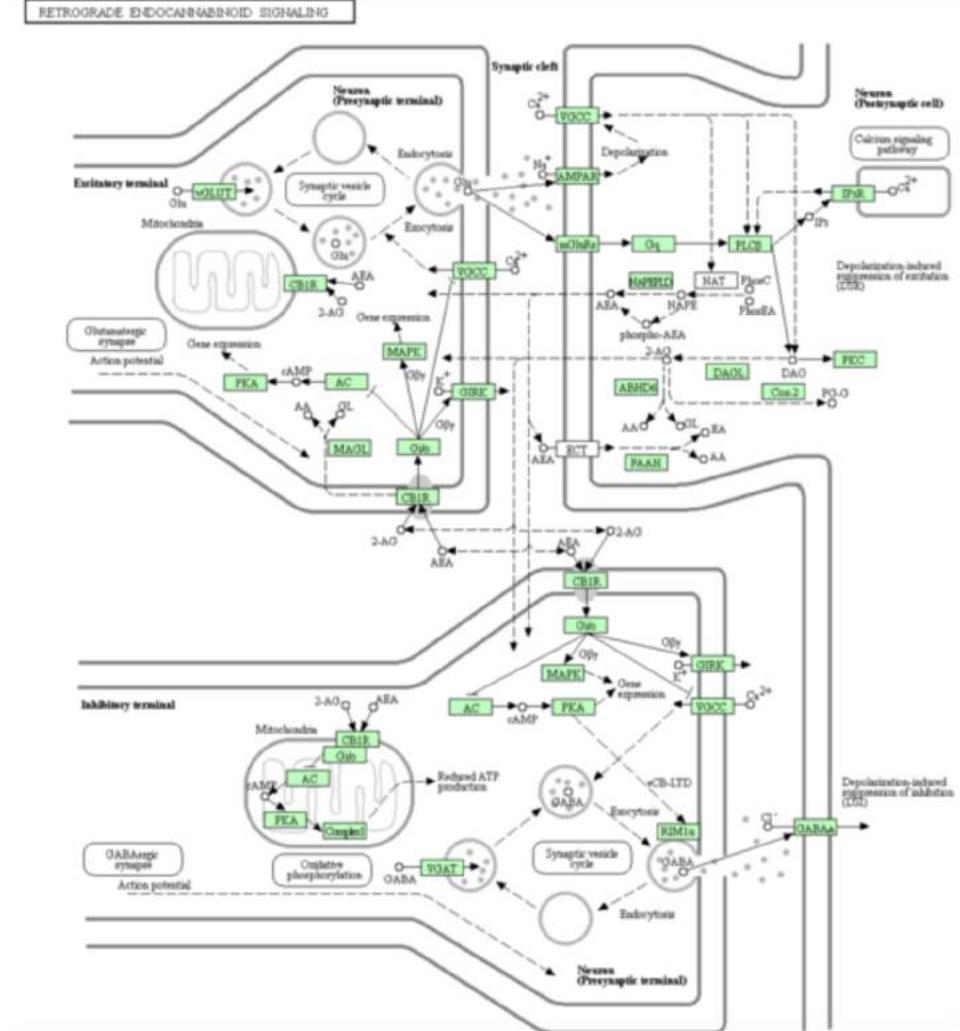

[ Pathway menu | Organism menu | Pathway entry | Download KGML | Hide description | User data mapping ]

**Endogenous cannabinoids (endocannabinoids) serve as retrograde messengers at synapses in various regions of the brain.** The family of endocannabinoids includes at least five derivatives of arachidonic acid; the two best characterized are arachidonoyl ethanolamide (anandamide, AEA) and 2-arachidonoyl glycerol (2AG). They are released from postsynaptic neurons upon postsynaptic depolarization and/or receptor activation. The released endocannabinoids then activate the CB1 receptors (CB1R) at presynaptic terminals and suppress the release of inhibitory transmitter GABA (depolarization-induced suppression of inhibition, DSI) or excitatory transmitter glutamate (depolarization-induced suppression of excitation, DSE) by inhibiting Ca<sup>2+</sup> channels. Besides the well-known expression of the CB1R in the plasma membrane, this receptor is also present in mitochondrial membranes, where it reduces the mitochondrial respiration and contributes to DSI. Whereas DSI and DSE result in short-term synaptic plasticity, endocannabinoids also mediate long-term synaptic changes (eCB-LTD). Persistent activation of CB1 receptors over a period of minutes triggers eCB-LTD by a RIM1alpha-dependent mechanism.

## Homo sapiens (human)

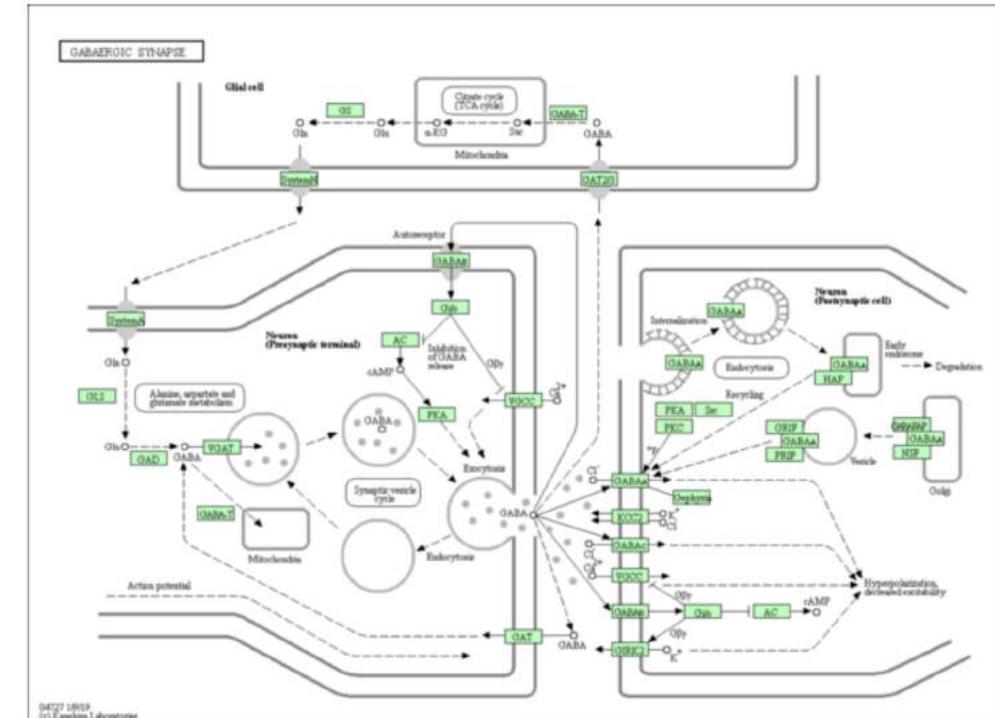

Go

100%

[ Pathway menu | Organism menu | Pathway entry | Download KGML | Hide description | User data mapping ]

Gamma aminobutyric acid (GABA) is the most abundant inhibitory neurotransmitter in the mammalian central nervous system (CNS). When released in the synaptic cleft, GABA binds to three major classes of receptors: GABAA, GABAB, and GABAC receptors. GABAA and GABAC receptors are ionotropic and mediate fast GABA responses by triggering chloride channel openings, while GABAB receptors are metabotropic and mediate slower GABA responses by activating G-proteins and influencing second messenger systems. GABAA receptors, the major sites for fast inhibitory neurotransmission in the CNS, are regulated by phosphorylation mechanisms, affecting both their functional properties and their cell surface mobility and trafficking. GABA release by the presynaptic terminal is negatively regulated by GABAB autoreceptors, and is cleared from the extracellular space by GABA transporters (GATs) located either on the presynaptic terminal or neighboring glial cells.

## Salivary secretion - Homo sapiens (human)

[ [Pathway menu](#) | [Organism menu](#) | [Pathway entry](#) | [Download KGML](#) | [Hide description](#) | [User data mapping](#) ]

Saliva has manifold functions in maintaining the integrity of the oral tissues, in protecting teeth from caries, in the tasting and ingestion of food, in speech and in the tolerance of tenures, for example. Salivary secretion occurs in response to stimulation by neurotransmitters released from autonomic nerve endings. There are two secretory pathways: protein exocytosis and fluid secretion. Sympathetic stimulation leads to the activation of adenylate cyclase and accumulation of intracellular cAMP. The elevation of cAMP causes the secretion of proteins such as amylase and mucin. In contrast, parasympathetic stimulation activates phospholipase C and causes the elevation of intracellular Ca<sup>2+</sup>, which leads to fluid secretion; that is, water and ion transport. Ca<sup>2+</sup> also induces amylase secretion, but the amount is smaller than that induced by cAMP.

## KO Database of Molecular Functions

The **KO (KEGG Orthology)** database is a database of molecular functions represented in terms of functional orthologs. A functional ortholog is manually defined in the context of KEGG molecular networks, namely, KEGG pathway maps, BRITE hierarchies and KEGG modules. For example, when a pathway map is drawn, each box is given a KO identifier (called K number) and experimentally characterized genes and proteins in specific organisms are used to find orthologs in other organisms. The granularity of "function" is context-dependent, and the resulting KO grouping may correspond to a highly similar sequence group and a limited organism group or it may be a more divergent group.

The KO system is a network-based classification of KOs shown below:

### KEGG Orthology (KO)

It consists of six top categories (09100 to 09160) for KEGG pathway maps and one top category (09180) for BRITE hierarchies, as well as one top category (09190) for those KOs that are not yet included in either of them. The category numbers for these top categories and the second-level categories under metabolism (09101 to 09112) are used to define color coding of functions (see [KEGG Color Codes](#)).

Major efforts have been made to associate each KO entry with experimental evidence of functionally characterized sequence data, now shown in the SEQUENCE subfield of the REFERENCE field. Similar efforts have also been made for EC numbers in [Enzyme Nomenclature](#). The addendum category of the GENES database, which allows functionally characterized individual protein sequences to be included in KEGG, have played major roles in these efforts.

[High-Throughput Home](#) [Web Interface](#) [Web Input](#) [Command Line Interface](#) [Command Line Input](#) [Output Files](#) [Examples](#) [Using CIMminer](#) [Error Codes](#) [Process Overview](#) [Supplementary Materials](#)

This is the web interface for High-Throughput GoMiner™. You need to upload two files to the server, a total file with all of the genes in your experiment, and one of two types of changed files. Detailed descriptions of the [input files](#) are available. You will receive an email message with instructions on how to download your results once they are complete. Documentation for both the [output files](#) generated and possible [error codes](#) are also online.

**Step 1:**

Select total file

OR

Select [Auto-Generate](#) option

**Step 2: Select the changed file**

Przeglądaj... Nie wybrano pliku.

Input should be a text file with '.txt' extension, if no file is specified

[Auto-Generate](#) (Increases Computation Time Significantly)

**Step 3: Select DataSource(s)**

Data sources:

WB (*C. elegans*)  
ZFIN (*D. rerio*)  
GR\_protein (*Oryza*)  
dictyBase (*discoideum*)  
PDB (*H. sapiens* et al.)

Specify semicolon separated list of data sources:

You find possible values at the [Gene Ontology web site](#); look at the abbrev. For example, UniProtKB and Mouse Consortium would be UniProtKB;MGI

**Step 4: Select Organism(s)**

Organisms:

All
H. sapiens
M. musculus
R. norvegicus

From list

OR

Enter list

## Link: CNS – Salivary content

inositol triphosphate (*IP<sub>3</sub>*) and diacylglycerol (*DAG*)/ These nerves release acetylcholine and substance P, which activate the *IP<sub>3</sub>* and *DAG* pathways respectively.

**DAG Pathway**

# Example 2

Functional analysis:

**Description of data:**

1. Condition: chronic kidney disease versus healthy
2. Sample: plasma
3. Mouse genome

## Abstract

Renal fibrosis, particularly tubulointerstitial fibrosis, is the common final outcome of almost all chronic kidney diseases. However, the mechanisms involved in the development of renal fibrosis are poorly understood. The Akt (also known as protein kinase B, PKB) family is serine/threonine protein kinases that play critical roles in regulating growth, proliferation, survival, metabolism and other cellular activities. Cytokines, high-glucose medium, transforming growth factor- $\beta$ 1 or advanced glycation end-products activate Akt in different renal cells. Increased Akt activation has been found in experimental tubulointerstitial fibrosis. In addition, Akt activation is also an important node in diverse signaling cascades involved in kidney damage. These data give evidence for a role for Akt in renal fibrosis, but no reviews are available on the role of Akt in the process. Thus, our aim is to review the role of Akt activation and signaling in renal fibrosis.

### TNF signaling pathway

Tumor necrosis factor (TNF), initially reported to induce tumor cell apoptosis and cachexia, is now considered a central mediator of a broad range of biological activities from cell proliferation, cell death and differentiation to induction of inflammation and immune modulation.

TNF exerts its biological responses via interaction with two cell surface receptors: TNFR1 and TNFR2. (TNFRs). These receptors trigger shared and distinct signaling pathways upon TNF binding, which in turn result in cellular outputs that may promote tissue injury on one hand but may also induce protective, beneficial responses. Yet the role of TNF and its receptors specifically in renal disease is still not well understood. This review describes the expression of the TNFRs, the signaling pathways

induced by them and the biological responses of TNF and its receptors in various animal models of renal diseases, and discusses the current outcomes from use of TNF biologics and TNF biomarkers in renal disorders.

# Vasopresin-regulated water re-absorption signaling pathway

Pflugers Arch. 2008 Sep;456(6):1005-24. doi: 10.1007/s00424-008-0498-1. Epub 2008 Apr 23.

## Physiology and pathophysiology of the vasopressin-regulated renal water reabsorption.

### Abstract

To prevent dehydration, terrestrial animals and humans have developed a sensitive and versatile system to maintain their water homeostasis. In states of hypernatremia or hypovolemia, the antidiuretic hormone vasopressin (AVP) is released from the pituitary and binds its type-2 receptor in renal principal cells. This triggers an intracellular cAMP signaling cascade, which phosphorylates aquaporin-2 (AQP2) and targets the channel to the apical plasma membrane. Driven by an osmotic gradient, pro-urinary water then passes the membrane through AQP2 and leaves the cell on the basolateral side via AQP3 and AQP4 water channels. When water homeostasis is restored, AVP levels decline, and AQP2 is internalized from the plasma membrane, leaving the plasma membrane watertight again. The action of AVP is counterbalanced by several hormones like prostaglandin E2, bradykinin, dopamine, endothelin-1, acetylcholine, epidermal growth factor, and purines. Moreover, AQP2 is strongly involved in the pathophysiology of disorders characterized by renal concentrating defects, as well as conditions associated with severe water retention. This review focuses on our recent increase in understanding of the molecular mechanisms underlying AVP-regulated renal water transport in both health and disease.

## gProfiler (online tool)

<https://biit.cs.ut.ee/gprofiler/gost>

### Downregulated genes

The screenshot shows the g:Profiler web interface. At the top, there's a navigation bar with links like Apps, AWS, SDCX g, Microservices, beluca, kursy, napomoc, fit, coding interview, trading, WolowTube - Wat..., and Table Browser-USC. Below the navigation bar is the main header with the g:Profiler logo and links for News, Archives, Beta, API, FAQ, Docs, Contact, Cite g:Profiler, Services using g:P, and List of organisms.

The main content area has four tabs: g:GOst (Functional profiling), g:Convert (Gene ID conversion), g:Orth (Orthology search), and g:SNPense (SNP id to gene name). The g:GOst tab is selected and highlighted in orange.

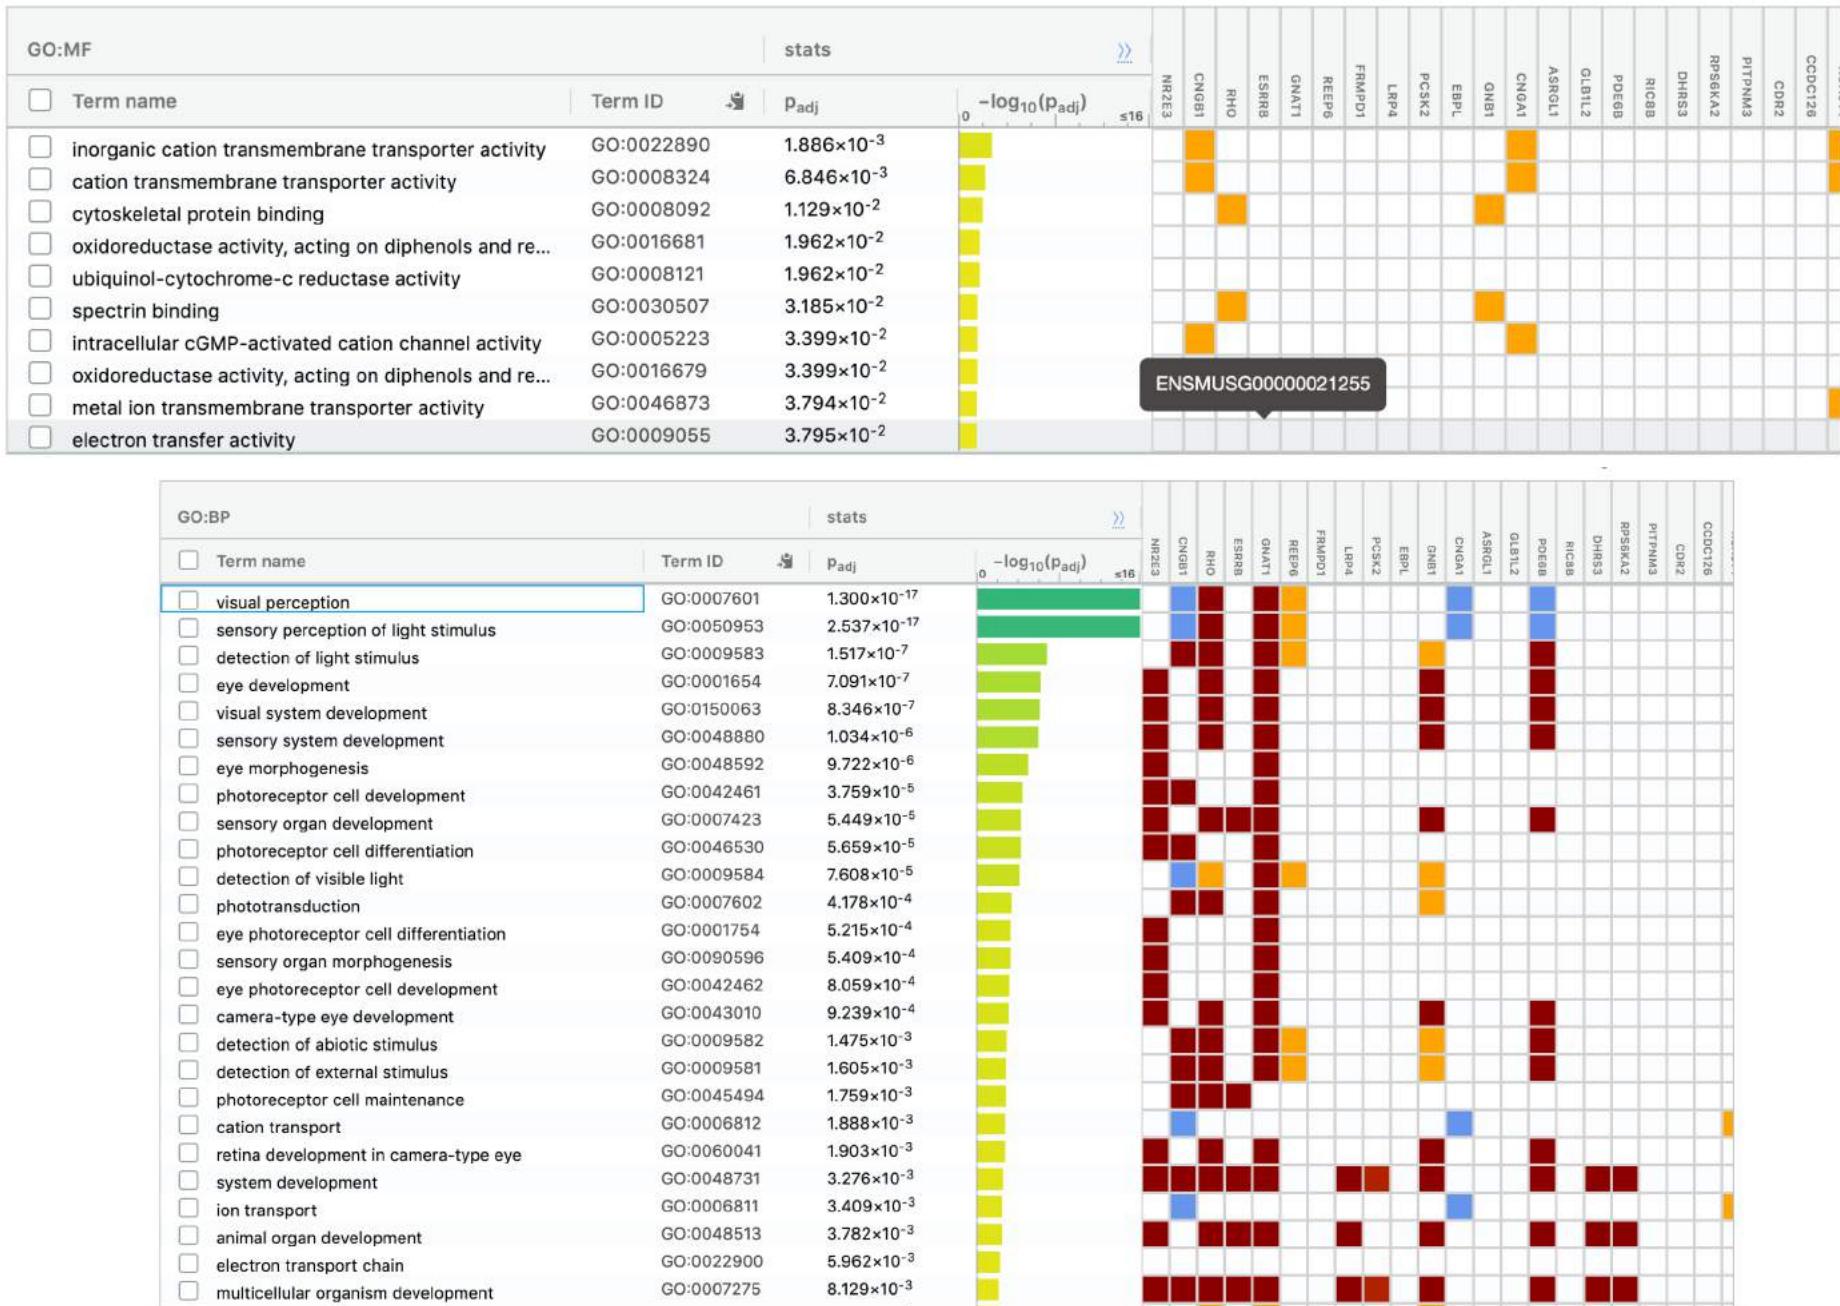

On the left, there's a sidebar with a list of genes: Rnf26, Klc3, Ccl27a, Fgd3, Gm5460, Ccdc88b, Hmx1, Rpl29, Olfm3, Col8a1, Eps8l1, Smad6, Dpm3, Grin2d. Below this list are two buttons: "Run query" (orange) and "random".

The central part of the interface is the "Options" section. It includes fields for "Organism:" (set to Mus musculus (Mouse)), "Query type:" (checkboxes for "Ordered query" and "Run as multiquery"), and "Advanced options" (checkboxes for "All results" and "Measure underrepresentation"). There are also dropdown menus for "Statistical domain scope" (set to "Only annotated genes") and "Significance threshold" (set to "g:SCS threshold"). The "User threshold" is set to "0.05".

On the right side, there's a "Data sources" section with buttons for "select all" and "clear all", and a link to "Show data versions". This section lists various databases and ontologies with checkboxes: Gene Ontology (GO molecular function, GO cellular component, GO biological process, No electronic GO annotations), biological pathways (KEGG, Reactome, WikiPathways), regulatory motifs in DNA (TRANSFAC, miRTarBase), protein databases (Human Protein Atlas, CORUM), and Human phenotype ontology (HP).
